Abstract: The conventional analysis of variance applied to designs in which each subject is measured repeatedly requires stringent assumptions regarding the variance-covariance (i. e., correlations among repeated measures) structure of the data. Violation of these assumptions results in too many rejections of the null hypothesis for the stated significance level. This paper considers ...

Permutational multivariate analysis of variance (PERMANOVA) is a geometric partitioning of variation across a multivariate data cloud, defined explicitly in the space of a chosen dissimilarity measure, in response to one or more factors in an analysis of variance design. Statistical inferences are made in a distribution-free setting using permutational algorithms. The PERMANOVA framework is ...

Using a simple moving average model, we forecast the next value(s) in a time series based on the average of a fixed finite number m of the previous values. Thus, for all i > m. Example 1: Calculate the forecasted values of the time series shown in range B4:B18 of Figure 1 using a simple moving average with m = 3.. Figure 1 Simple Moving Average Forecast

Profiling multi-platform genomics of 110 cancer patients with an exceptional therapeutic response, Wheeler et al. identify putative molecular mechanisms explaining this survival phenotype in 23% of cases. Therapeutic success is related to rare molecular features of responding tumors, exploiting synthetic lethality and oncogene addiction.
